

SEMI-AUTOMATIC TANK FILL

Pressing the button starts filling. Stops automatically when high float is reached. Emergency overfill alarm.

Model LC-6 or LC-7 are rugged tank level filling devices that can be installed in minutes by just plugging into AC power.

OPERATION

When liquid level is below the float switches, press the button to start a refill. The connected solenoid valve (or pump) starts to fill the tank. When the level reaches the lower float switch the filling will stop. If for any reason the liquid level reaches the upper float switch, an emergency alarm is given. This allows the operator to walk away instead of waiting around.

FEATURES

- Waterproof. Suitable for wash down duty.
- Built-in float guard protects the float switch for rough use.
- 103dB piezo alarm.
- Automatically resets.
- Pre-wired solenoid valve option.
- Easily adjust the depth without tools using the thumbscrew.

OPTIONS

LC-6 has electronics mounted on the tank. LC-7 has the same features but the electronics are mounted on the wall. Different materials: polypropylene, PVDF, or stainless steel.
